PROFESSIONAL SUMMARY

Java Backend Developer with 1+ year of experience building Spring Boot microservices for a production real-time consultation platform. Improved API performance by 30% with Redis caching and query optimization, raised message throughput by 25% with RabbitMQ, and cut manual release effort by ~40% through CI/CD automation on Kubernetes.

TECHNICAL SKILLS

Languages & Frameworks: Java, Spring Boot, Spring Security
Architecture & APIs: Microservices, REST APIs, Event-Driven Architecture, Distributed Systems
Security: JWT (Access & Refresh Tokens), Keycloak, Role-Based Access Control (RBAC)
Databases & Caching: MySQL, PostgreSQL, MongoDB, Redis
Messaging: RabbitMQ
Testing: JUnit, Mockito
Cloud & DevOps: AWS (EC2, S3, RDS), Docker, Kubernetes, Helm, ArgoCD, GitHub Actions
Tools: Git, GitHub, Postman, Swagger, OpenAPI
CS Fundamentals: DSA, OOP, DBMS, Operating Systems, Computer Networks.

WORK EXPERIENCE

Java Developer | Amplied Technologies LLP
Aug 2025 – Present

- Contributed to a **23-service Spring Boot microservices architecture** within a 2-engineer team, developing backend functionality across authentication, user management, wallet, payments, subscriptions, and notifications.
- Improved p95 latency of high-traffic REST APIs by **30%** using Redis caching, PostgreSQL query optimization, and database indexing.
- Integrated **RabbitMQ-based asynchronous messaging** across 19 modules, reducing service coupling and improving message throughput by **25%**.
- Improved reliability under concurrent workloads through retry mechanisms with exponential backoff, dead-letter handling, and idempotent message processing.
- Secured REST APIs using **Spring Security, JWT access and refresh tokens, Keycloak, and role-based access control (RBAC)**.
- Contributed to payment-service workflows involving **server notifications, refunds, and recurring subscription charges**.
- Containerized and deployed Spring Boot services using **Docker, AWS ECR, Kubernetes, and Helm**, with readiness probes and environment-specific deployment configurations.
- Automated CI/CD workflows using **GitHub Actions and ArgoCD** for image builds, ECR publishing, and Helm configuration updates, reducing manual release effort by approximately **40%**.
- Contributed to **JUnit and Mockito testing** for payment, subscription, and pricing logic.

RELEVANT PROJECTS

Attendance Management System

- Built a role-based attendance system with RESTful APIs, organized into reusable service and repository layers.
- Implemented authentication and authorization with Keycloak, enforcing RBAC for Admin and User roles.
- Stored attendance and user data in MySQL and audit logs in MongoDB to track application activity.
- Cached frequently accessed data in Redis to reduce repeated database queries and improve response times.
- Used RabbitMQ for asynchronous processing, decoupling components of the application.

EDUCATION

Bachelor of Computer Applications (BCA)
IAMR Group of Institutions | 2022 – 2025
